

## POLYETHYLENE PIPES

polyethylene pipes are profiled, double wall pipes with outside corrugate and inside smooth surface.

Application:

- sewerage
- Drainage
- Protection of optical cables
- Protection of telephone cables

The profile of the double wall corrugate pipe is made of:

- OD: outside diameter, standardized according to EN 13476-3
- ID: inside diameter, with a higher value than the standard thickness

The rib has the traditional half rounded structure, entirely retaining the attributes for integration and continuity between internal thickness and the rib.
